

A NOTE FROM YOUR GARAGE

# Catch it early. Save bigger bills later.

A blocked DPF rarely happens overnight. By the time the warning light is on, the filter has already been working hard for thousands of kilometres. The good news? It can almost always be cleaned - not replaced.

CLEANING VS REPLACEMENT

## Upto 10x cheaper to clean

A new factory DPF can cost ₹1,20,000 - ₹3,50,000+. A professional clean at a certified DPF Cleaning Centre costs a fraction of that - and your filter goes back into your vehicle the same day.

DPF Cleaning Centre:  
Mobile Number:  
Email:

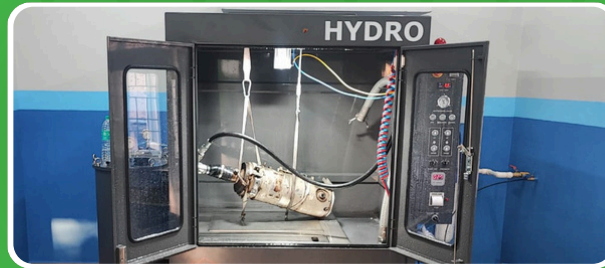

Cleaning early helps you avoid bigger repair bills later. A clean filter protects the turbo, the EGR, and your wallet.

WHY DPF CLEANING CENTRES

# Don't *replace*. clean.

## Our Promise

India's largest certified DPF cleaning network, powered by V-Tech India. Every centre uses the same OEM-grade equipment, the same trained process, the same standard of care for your filter.

95%  
SOOT PARTICLE  
REDUCTION

10x  
CHEAPER THAN  
REPLACEMENT

FOR DIESEL VEHICLE OWNERS

# DPF WARNING LIGHT ON?

Clean before you  
have to replace.

### Helps avoid replacement

Up to 10x cheaper than buying a new DPF

### Cuts fuel consumption

A clean filter means fewer rupees per kilometre

### Restore lost power

Removes the back-pressure choking your engine

**BOOK YOUR DPF CLEAN TODAY**

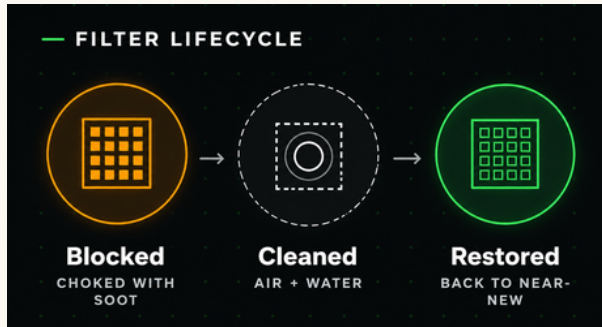

AVAILABLE AT EVERY CERTIFIED DPF CLEANING  
CENTRE ACROSS INDIA.

## 1 THE BASICS

# What is a *DPF*?

Your **Diesel Particulate Filter** sits in the exhaust line. Its job is to trap soot and ash before they leave the tailpipe - keeping the air cleaner and your engine certified to emissions standards.

Normally, the engine burns off this soot in short cycles called **regeneration**. But in stop-go city traffic, regen often can't finish - and over time, soot builds up until the filter blocks.

### THE PROBLEM IS

Short trips. City traffic. Long idling. Lower-grade fuel. These conditions **stop the regeneration cycle** from completing - so the soot doesn't burn off, and the filter slowly chokes. It's not a fault. It's just physics.

## 2 THE CHECKLIST

# Signs your DPF *needs cleaning*.

If any of these sound familiar, your filter is asking for attention. **Don't wait** - the longer you drive a blocked DPF, the harder it is to recover.

- ! DPF warning light is on**  
Glowing on your dashboard - even if it flickers off, the filter has been blocked long enough to trigger the sensor.
- ! Power loss**  
Vehicle suddenly capped at 40-60 km/h. Throttle feels heavy. Acceleration is slow even with the pedal pressed.
- ! Frequent forced regens**  
Engine fan running hard at standstill. Smell of burning. Regen cycles starting often but never finishing.
- ! Higher fuel consumption**  
Same route, same load - but the tank is emptying faster. A blocked filter makes the engine work harder for every kilometre.
- ! Visible smoke or PUC failure**  
Dark smoke on acceleration. Failed pollution-under control test. Both point to a filter that's no longer doing its job.

### WHEN TO PLAN A CLEAN

**Every 1,00,000 - 1,20,000 km  
- or sooner for city duty.**

Delivery, ride-share & construction vehicles: clean every 60,000-80,000 km. Heavy trucks: every 2 years, whichever comes first.

## 3 THE PROCESS

# What your garage *will do*.

Each unit goes through a clear, documented cleaning process, with **before-and-after** proof at every stage.

- 1 Pre-clean test**  
Your DPF is checked first to confirm it is suitable for cleaning and in good condition to proceed.
- 2 Pre-clean photos**  
We take detailed before photos of the DPF to document its condition before cleaning.
- 3 Machine cleaning**  
The DPF is placed in our specialist cleaning machine. It is cleaned first with water, followed by air cleaning to remove loosened soot and ash.
- 4 Testing and reporting**  
Once cleaning is complete, the DPF is tested again. A printed report shows the results before and after cleaning.
- 5 Post clean photos**  
We take after photos of the cleaned DPF, giving you a clear before-and-after comparison.
